

# Trust in AI Recommendations in Supply Chain Planning

Eirini Spiliotopoulou (TiU)

Joint work with

Willem van Jaarsveld (TU/e) and Lijia Tan (TU/e)

# Motivation

**Many supply chain planning decisions increasingly rely on the guidance of AI-based algorithms**

Such as forecasting, ordering and production decisions

**Planners remain responsible for decision outcomes**

Discretion to adjust algorithmic recommendations

**Focus: complex decision problems**

Uncertainties, delays, interrelated decisions  
Sophisticated AI tool can significantly improve operational outcomes

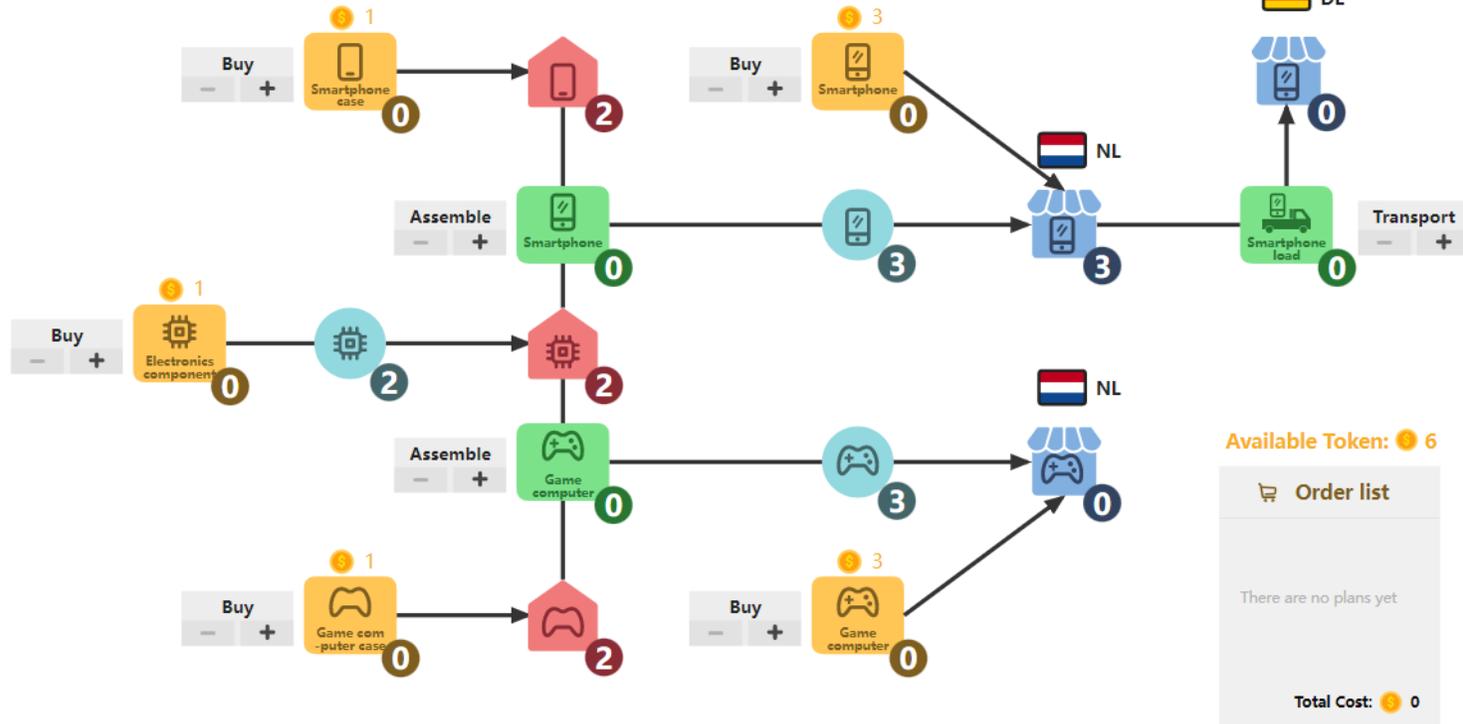

# Research questions

**How does AI help human planners' decisions in a supply chain?**

1. Do people *use* the AI tool in planning i.e., *trust* the algorithmic recommendations?
2. Does the AI tool help humans *learn* effective strategies in a complex setting?

## Round 1

1st Super Game

Please click the "+" or/and "-" in the gray rectangles to place your plan. Click "OK" to submit your plan.

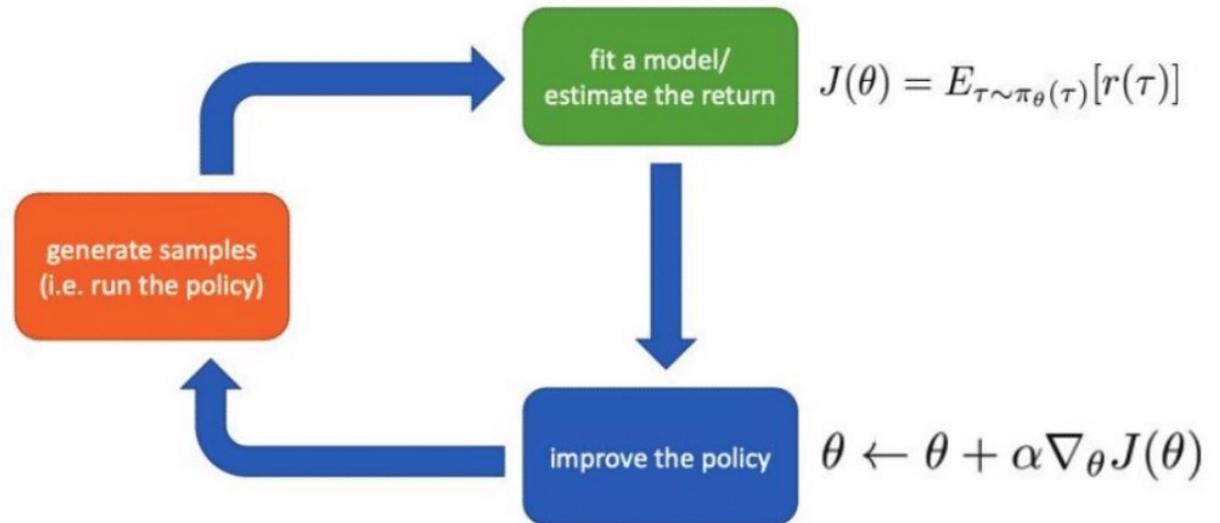

Press to  
preview AI plan

OK

# Game Setting

# The algorithm

- Neural network algorithm
  - Trained a model via trial and error methods/reinforcement learning
  - Employed DynaPlex/DCL
- Performs quite well in the context!
  - Clearly outperformed PPO
  - Outperformed about 50 human subjects in semi-controlled trial, where the algorithm was fed the same demand sequence as the humans.
  - Outperforms several well-known heuristics.

# Example

The screenshot shows a web browser window with the title "The Supply Chain Management" and a URL "185.84.140.223/netherland/play/6454ed10f2...". The game interface is titled "Round 1" and "1st Super Game". It features a supply chain network with nodes for buying, assembling, and transporting products. The products are Smartphone case, Smartphone, Electronics component, Game computer, and Game computer case. The network is connected to a warehouse in the Netherlands (NL) and a store in Germany (DE). The score is 0, and the available tokens are 6. The order list is empty, and the total cost is 0. The interface includes a "Reset the plan" button, an "Apply AI plan" button, a "Press to preview AI plan" button, and an "OK" button.

Round 1  
1st Super Game

SCORE: 0

# Experimental Design

Controlled between-subjects incentivized laboratory experiments

<b>Treatment</b>	<b>Game 1</b>	<b>Game 2</b>	<b>Game 3</b>	<b>No Subjects</b>
<i>Baseline</i>	No AI	No AI	No AI	34
<i>Learning</i>	No AI	AI	No AI	39
<i>Experienced</i>	No AI	No AI	AI	38
<i>AI-able</i>	No AI	AI	AI	39
<i>Total</i>				150

Subject pool:  
university students  
(CentERLab)

Each game has 10  
rounds, each subject  
plays 3 games in  
total

Each session lasted  
around 1,5 hours

Payment based on  
performance:  
~ 21,4 Euros

# Do decision makers use AI plans (as-is)?

- Looking at the plan implemented in a round (when AI tool is available)...
- Only 13 out of 116 subjects (13%) *always* followed AI plans as-is

Used AI plan As-Is	Deviated from AI plan
49,7%	50,3%

Decision makers largely **use** the AI tool (even if it is “black-box”)  
.... *but* they also very frequently **modify** it

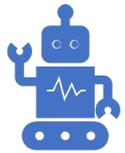

# How often do decision makers deviate from AI recommendations?

- We look at each type of decision separately:

<u>Decision</u>	Deviations from AI recommendations			
	Avg	Frequency	Game 2	Game 3
Buy smartphone case	0,26	18,5%	20,8%	16,2%
Buy electronics	0,55	25,3%	28,5%	22,1%
Buy computer case	0,18	14,2%	17,2%	11,2%
Buy smartphone	0,18	15,4%	15,5%	15,3%
Buy computer	0,11	9,2%	9,4%	9,1%
Assemble smartphone	0,11	8,8%	11,3%	6,4%
Assemble computer	0,10	8,8%	10,6%	6,9%
<i>Total</i>		14,3%	16,2%	12,4%

*\*For each decision we look at the (absolute) difference between the planner's choice and the AI recommendation*

# Individual-level characteristics

## General attitude toward AI/algorithmic tools

Questionnaire based on Technology Acceptance Model (TAM) (Davis (1989)

(1) perceived usefulness, (2) perceived ease of use, (3) attitude towards use, (4) intention to use of AI/algorithmic tools in general

## Risk attitude

Incentivized Holt & Laury (2002) task

## Cognitive reflection

CRT Test (Frederick, 2005)

## Demographics

Gender, age, experience etc

# What drives trust in AI recommendations?

Or alternatively, deviations from AI suggestions?

deviation_AI	Coefficient	Std. err.	z	P> z
TAM_score	<b>-.0610551</b>	<b>.0231279</b>	<b>-2.64</b>	<b>0.008</b>
crt_score	<b>-.1553413</b>	<b>.1129392</b>	<b>-1.38</b>	<b>0.169</b>

sigma_u	<b>1.2048289</b>			
sigma_e	<b>2.1562915</b>			

General Attitude towards  
AI/algorithmic tools

Task experience

# Do planners make better decisions when they trust AI more?

- Participant's score in a round *decreases* in the size of deviations from AI recommendations (*similar results for total game score*)

roundscore	Coefficient	Std. err.	z	P> z
cum_total_dev_AI	<b>-.0051326</b>	<b>.0017401</b>	<b>-2.95</b>	<b>0.003</b>
round	<b>.0909159</b>	<b>.0076102</b>	<b>11.95</b>	<b>0.000</b>
demand	<b>.6824941</b>	<b>.0123098</b>	<b>55.44</b>	<b>0.000</b>
_cons	<b>.1039195</b>	<b>.0536414</b>	<b>1.94</b>	<b>0.053</b>
sigma_u	<b>0</b>			
sigma_e	<b>.69905099</b>			

Lower trust in AI has a negative effect

*Panel data random effects regression, grouping variable participant*

# Does AI tool availability improve performance?

- Comparison of Total Game Score between Baseline and AI-able

	Total Score								
	Game 1			Game 2			Game 3		
	Avg	Median	St.dev	Avg	Median	St.dev	Avg	Median	St.dev
Baseline	22,6	23,0	3,8	24,8	25,0	2,7	25,5	26,5	3,1
AI-Able	23,1	23,0	3,1	26,2	27,0	2,8	25,6	26,0	3,4

- Total score is *not* different in Game 1 ( $p=0.4495$ ) and Game 3 ( $p=0.9956$ )
- Total score *is* different *in* Game 2 ( $p=0.0310$ )

*(Wilcoxon rank-sum tests at the subject level)*

- *AI seems to help improve planning decisions but only for less experienced planners*

# Do planners learn from AI algorithms?

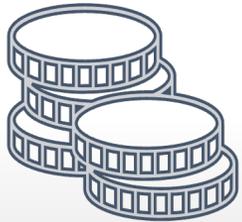

## Preliminary analysis

- We look at subject differences in performance between Game 1 and Game 3
- And compare between the *Baseline* (No AI) and *Learning* (No AI - AI - No AI) treatments
- “Learning” = Total Score Game 3 – Total Score Game 1

	"Learning"		
	Avg	Median	St.dev.
Baseline	2,9	3,0	3,6
Learning	2,5	2,0	4,3

*Caution!* demand uncertainty realizations are not taken into account!

# Next steps

Look at *hypothetical* profits instead of realized profits, to account for randomness in demand realizations

- What if the decision maker had followed the AI suggestions?

Focus on *learning* and specific strategies

- Do planners learn from the AI tool strategies that perform well in this context but are non-intuitive?

# Thank you!
